

A SMARTER WAY TO TREAT CHRONIC SINUSITIS.

1 in 7 adults are affected by Chronic Sinusitis each year, making it one of the most common health conditions in America¹.

The sinuses are air-filled cavities located within the bones around the nose and eyes that allow for air flow and drainage. In Chronic Sinusitis, the sinus linings become swollen (inflamed), preventing natural drainage of the pathways, leading to chronic infections and nasal blockage.

Patients with Chronic Sinusitis suffer from symptoms such as:

- Facial pain or pressure
- Nasal congestion & difficulty breathing
- Discolored nasal discharge
- Loss of smell & taste
- Headache
- Fatigue & depression

Treatments for chronic sinusitis

Medications often prescribed for Chronic Sinusitis patients:

- Antibiotics
- Oral steroids
- Nasal steroid sprays
- Decongestants
- Antihistamines

If patients' symptoms continue even with medications, sinus surgery may be an option. During the surgery, the Ear, Nose and Throat (ENT) surgeon will enter the sinuses through the nostrils to open blocked sinus pathways and clean out infection. Opening the inflamed sinus pathways allows the sinuses to drain better and improves air flow.

While surgery provides benefit to many patients, inflammation and scarring can take place even in the first 30 days, diminishing the impact of surgery or causing symptoms to return. There is now a new technology that is placed at the time of surgery and clinically proven to reduce inflammation and scarring². Read on to learn more about PROPEL[®].

ABOUT PROPEL[®]

MOMETASONE FUROATE IMPLANT

PROPEL is clinically proven to improve surgical outcomes for chronic sinusitis sufferers.

When placed in the sinus following surgery, PROPEL decreases scarring and inflammation, reducing the need for additional surgical procedures as well as oral steroids and their potential side effects².

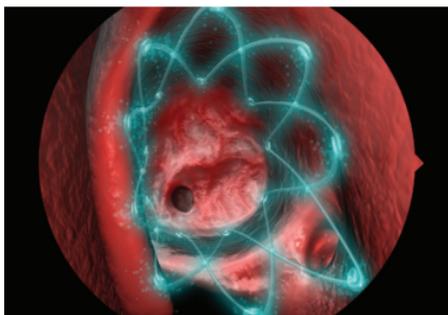

The spring-like PROPEL implant props open the ethmoid sinus to maintain the surgical opening, delivers an anti-inflammatory medication directly to the sinus lining, and then dissolves, avoiding the need for removal.

Talk with your doctor to see if PROPEL is the right option for you.

Post-operative care

After surgery, your care may include nasal irrigation (e.g Neilmed Sinus Rinse[™], LAVI Sinus Wash), oral antibiotics and pain medicine. Take all of your medication as directed for the best outcomes.

Additionally, you can expect some bleeding, drainage and discomfort (e.g. pain, headaches). Sleeping with your head elevated 30 degrees is helpful to reduce sinus swelling and bleeding. Try your best not to blow your nose, bend over, lift heavy objects or physically exert yourself for 1-2 weeks after surgery. If you have to sneeze or cough, keep your mouth open and avoid pinching your nose.

Specific to PROPEL:

Frequent sinus irrigations are very important for the healing process. Irrigation supplies (e.g Neilmed Sinus Rinse[™], LAVI Sinus Wash) can be purchased at most pharmacies. Additionally, if PROPEL was implanted, you may notice thin white fragments migrate from your nose as it dissolves—this is normal.
